WEEK 5: EVIDENCE VALIDATION & AS-IS PROCESS REVIEW

Course: Business Systems Analysis

Instructor: MSc. Nguyen Thi Thanh Thanh

Faculty: Faculty of Technology

Learning Objectives

Make sure your AS-IS process model accurately represents the process you investigated and experienced during previous sessions.

By the end of this lesson, your group should have:

- reviewed the available evidence;
- checked the scope and quality of the AS-IS model;
- identified missing, unclear, or incorrectly sequenced steps;
- corrected the model based on evidence;
- recorded information that still needs verification.

➢ ***Model what the evidence supports, not what you think should happen.***

How We Will Work Today

Phase 1 — Think Independently

Individual work · Paper only · 10 minutes

Review your group's process and complete the individual review sheet.

Keep laptops closed. Do not use generative AI.

Phase 2 — Review as a Group

Group discussion · Paper only · 30 minutes

Compare your findings, check the evidence, and agree on what to keep, correct, or mark as uncertain.

Phase 3 — Update in Miro

One laptop per group · 35 minutes

Update the AS-IS model based on the group's decisions.

Phase 4 — Peer Review (20 minutes)

Exchange models with another group and review their clarity and accuracy.

Phase 5 — Revise and Submit (35 minutes)

Address feedback, complete the final checks, and submit your individual exit ticket.

What Counts as Evidence?

- Use the information collected during previous sessions.

Evidence Source	What It Can Tell You
Stakeholder interview notes	What a stakeholder says they do
Week 4 role cards and data sheets	Role responsibilities, business rules, and available information
Physical forms and documents	What information is exchanged between actors
Simulation observations	What actually happened when your group performed the transaction
Observer log	Where work stopped or became unclear
Week 4 process records	Activities, handoffs, and decisions observed during the simulation

Before changing a process step, ask:

- What evidence supports this step?
- Where did this information come from?
- Does the evidence support the sequence shown in the diagram?

➢ Evidence from the assigned simulation supports your analysis of that scenario. Do not present unverified assumptions as established facts.

Confirmed, Uncertain, or Assumption?

- Use these labels when reviewing your process information.

Status	Meaning	Example
CONFIRMED	Directly supported by available evidence	Warehouse checks stock before reporting availability.
UNCERTAIN	Information is incomplete or unclear	It is unclear who contacts the customer when an item is unavailable.
ASSUMPTION	Believed to be true but not verified	Sales probably updates the order after receiving the stock status.

Your task

- For important process steps, determine whether the information is confirmed, uncertain, or assumed.
- Do not silently change an assumption into a confirmed fact.
- If information is unclear, record the question instead of inventing an answer.

Check Your Process Scope

- Before reviewing individual activities, check the overall process.

Process Element	Guiding Question
Process Name	Does the name describe a specific business process?
Trigger	What event starts the process?
Start Point	Where does the process begin?
End Point	Where does the process end?
Business Outcome	What result should the process produce?
Main Actors	Which roles participate in the process?

Scope Check

- Can someone outside your group understand exactly which transaction your process model describes?
- If the scope is too broad, identify the specific transaction and its boundaries. Use available evidence to justify any change.

AS-IS Process Quality Checklist

- Review the model step by step.

Quality Check	✓ Clear	? Unclear	✗ Missing
Process name and scope are specific			
Trigger and start point are clear			
End point and business outcome are clear			
Every activity has an identifiable actor			
Activity names describe clear actions			
Activities follow a logical sequence			
Required information is identified where known			
Handoffs between actors are clear			
Known decisions and exceptions are represented			
The model matches the simulation evidence			
Assumptions and uncertainties are identified			

Important: An AS-IS model represents the current process, including existing difficulties and workarounds. Do not remove a problematic step just because you think it is inefficient.

Individual Activity: Review Before Discussing

Time: 10 minutes · Work independently on your printed worksheet

Use your Week 3 simulation records and your group's current AS-IS model.

Answer these questions independently:

1. What is one step that accurately represents what happened during the simulation?

   Identify the supporting evidence.

2. What is one missing, unclear, or incorrectly sequenced step?

   Explain what you observed.

3. What is one point that remains uncertain?

   Identify what information would be needed to verify it.

4. What would you recommend for this part of the model?

   Keep the current step.

   Revise the step.

   Mark it as uncertain.

Explain your choice.

Rules

- Keep your laptop closed.
- Do not use generative AI.
- Use your own observations and reasoning.
- Complete the worksheet before discussing answers with your group.

Group Activity: Evidence Audit

Share your individual findings with your group.
For every proposed correction, complete this table together.

AS-IS Step / Issue	Supporting Evidence	Status	Group Decision
		Confirmed / Uncertain / Assumption	Keep / Revise / Verify
		Confirmed / Uncertain / Assumption	Keep / Revise / Verify
		Confirmed / Uncertain / Assumption	Keep / Revise / Verify

Discussion Questions

- Did this actually happen during the simulation?
- Which role performed the activity?
- What information was exchanged?
- What happened next?
- Is the current model inaccurate, or is the information simply incomplete?

Before opening Miro

- Your group must agree on the changes it intends to make and the evidence supporting those changes.

➢ *Do not redraw the process from scratch without reviewing the existing model first.*

Update Your AS-IS Model in Miro

Now update your group's existing Miro board.

Task 1 — Correct the Process Scope

- Check the process name, trigger, start point, end point, and business outcome.

Task 2 — Correct the Activities

- Add missing activities supported by evidence.
- Correct the sequence where necessary.
- Clarify who performs each activity.
- Use clear action labels, such as Check Stock Availability or Verify Payment.

Task 3 — Correct Information and Handoffs

- Show the relevant information exchanges between actors.

Task 4 — Check Decisions and Exceptions

- Represent known decisions and exception paths where supported by the evidence.

Task 5 — Mark Uncertainty

- Do not invent missing information. Record unresolved questions in your Miro notes.
- Update the existing model based on the evidence and the group's review decisions.

Peer Review: Can Another Group Understand Your Process?

- Exchange your AS-IS model with another group.
- Review the model using only the diagram and the supporting notes provided.

Review Question	Yes	Needs Revision
Is the process scope clear?		
Can we identify the trigger and outcome?		
Is each activity assigned to a role?		
Is the sequence understandable?		
Are information handoffs clear?		
Are known decisions and exceptions shown?		
Are assumptions and uncertainties marked?		
Does the model match the available evidence?		

Provide Two Comments

One thing that is clear:

One thing that needs clarification:

The reviewing group should identify unclear parts, not invent process details on behalf of the authors.

Final Check and Group Deliverable

WEEK 5 — VALIDATED AS-IS PROCESS

Submit the updated Miro board with the following sections.

Part 1 — Process Scope

Process Name

Trigger

Start Point

End Point

Business Outcome

Main Actors

Part 2 — Evidence Review

Relevant evidence sources

Confirmed information

Uncertain information

Assumptions requiring verification

Part 3 — Revised AS-IS Process

Activities and actors

Logical sequence

Information and handoffs

Known decisions and exceptions

Clear start and end points

Part 4 — Validation Notes

Changes made after the evidence audit

Unresolved questions

Peer-review feedback

Corrections made after peer review

Submission Rules

One Miro board per group.

Retain the final AS-IS model and supporting review notes.

Ensure that all group members understand the process.

Do not include a TO-BE model or proposed technology solution in this week's deliverable.

Individual Exit Ticket

Complete this independently before leaving class.

1. What is one change your group made to the AS-IS model? What evidence supported it?
2. Which part of the process remains uncertain or requires further investigation?
3. How can you distinguish an evidence-supported process step from an assumption?
4. Why must the AS-IS model accurately represent the current process before we analyze business problems?

Use your own words and refer to your group's actual work.
